

### **Project Description:**

My personal homepage will showcase my mission, past projects, and endeavors for employers to look at for the hiring process. The site will function as a portfolio where recruiters can quickly understand who I am, my experience, and how to reach me. As my creative addition, I will add an animated SVG signature, where my name draws itself in like a signature when the page loads. This uses pure CSS with stroke-dasharray and stroke-dashoffset.

### **User Personas:**

1. Rachel - Technical Recruiter  
Rachel is 32 and works at a mid-sized tech company. She screens dozens of candidates a week and rarely spends more than two minutes on any single portfolio. She wants to quickly verify that a candidate's skills match the job description and find a resume or contact link without digging.
2. David - Engineering Manager  
David is 41 and leads a backend team. After a recruiter shortlists a candidate, he digs deeper into their actual work, such as reading code on GitHub, looking at project write-ups, and judging technical depth. He looks for what problems were solved, how they were thought through, and whether the candidate can communicate clearly in writing.
3. Sam - Peer Developer  
Sam is 22, a fellow student or early-career developer who found the site through a LinkedIn post. They're curious about the experience of a peer developer and want to learn from the project write-ups, and might reach out to collaborate or ask questions.

### **User Stories:**

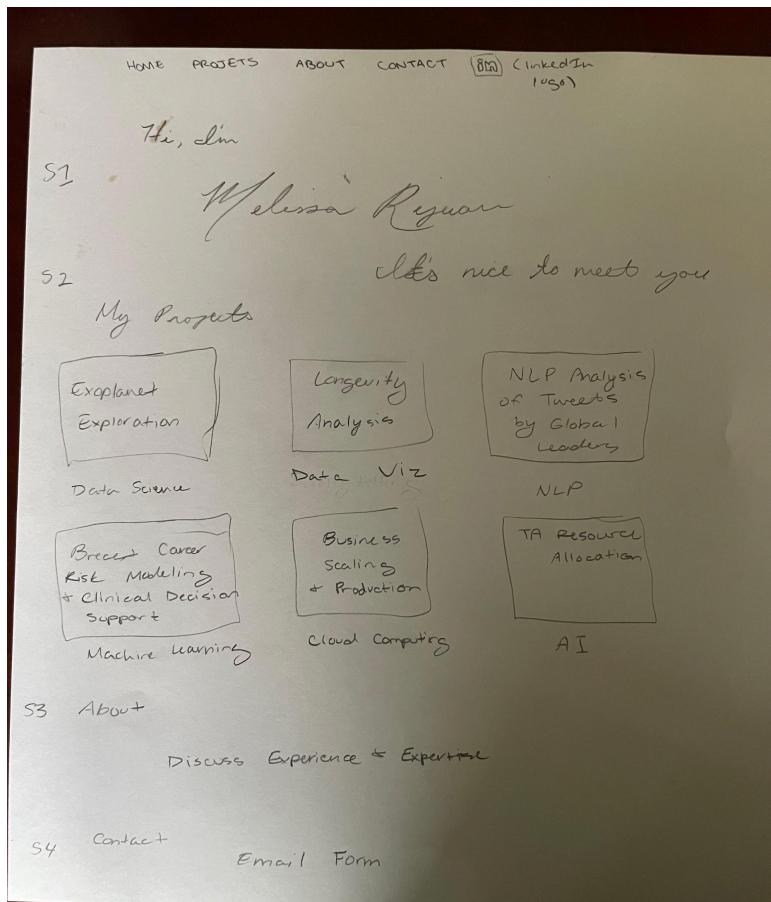

Rachel opens the homepage on a Tuesday afternoon between candidate calls. Within the first scroll, she sees a clear headline and three featured projects with one-line descriptions. She clicks the "Resume" link in the top nav, the PDF opens in a new tab, and she saves it to the candidate's file. She moves the candidate to the next round.

David receives Rachel's candidate list and pulls up the homepage on his laptop. He goes straight to "Projects." He clicks into the second project, a distributed task queue, and reads the write-up: the problem, the architecture decisions, what broke, and what was learned. He clicks through to the GitHub repo, skims the README and a few commits,

and forms a strong opinion about the candidate's engineering judgment before the interview.

Sam sees the site shared on LinkedIn and opens the site. They scroll the full page out of curiosity, click into the "About" section to read the mission statement, and notice the candidate uses a tech stack they've been wanting to learn and co-oped at a company they are interested in. They tap the contact link, send a short message asking about the project and the co-op.

### Design Mockup Sketch:

About:

Hi! My name is Melissa Rejuan. I grew up in Staten Island, New York and moved to Boston in 2021 to pursue a Bachelor's in Data Science and Journalism at Northeastern University. I graduated in Fall 2025 and I continued my education at Northeastern, pursuing a Master's in Data Science via the PlusOne program. My time at Northeastern was deeply valuable. I did my first co-op at Insulet and then my second one at The Boston Globe. After finishing my co-ops, I

decided to pursue my own venture! I founded a start-up called Navda AI, where we provide AI receptionist services across various industries. Currently, I am working on finishing up my masters, which will be done in August! Aside from my education and work experience, I love to cook, bake, and watch documentaries. I am a big history fan. I love to spend time with family, friends, and go on runs, specifically at scenic parks!
